B. Scope & Methodology

This report is based on interviews with fifteen users of outsourcing services, 14 of whom use applications management services, and interviews with fifteen outsourcing vendors.

The scope of the outsourcing market is shown in Exhibit I-1.
Exhibit I-1   Scope of Outsourcing Market

```
                      ┌──────────────┐
                      │ Outsourcing  │

```

Each of these elements is defined as follows:

- *Outsourcing* - Contracting for all or a major portion of an information system function or process to a vendor on a long-term basis.

- *Systems Operations* - Contracting out, to a vendor, the information systems operations in either of two ways:

  Platform Systems Operations - The vendor is responsible for managing the computer systems and their associated networks.

  Applications Systems Operations - The vendor is responsible for developing and/ or maintaining applications

The activities shown in Exhibit V-3 are as follows:

- ACSM Oslo - Andersen Corporate Systems Manager responsible for the coordination of the world-wide systems management methods and techniques called 'Method/SM'.

- Engineering Services providing Operations Engineering services, consultancy within BOM, Foundation (a CASE tool), Programme Control (overall program control of all projects within each client, thus involving staff control, re-engineering and the rationalisation of hardware) and some government projects.

- Production services providing data centres in Bristol, Harrogate and London (the most recent)

- Sales & Service being primarily *Applications Management and Support.* (AMS)

- Accounting Services being primarily the outsourced accounting activity of BP Exploration of Scotland, but new clients are being added.

- Implementation including the management of systems particularly human resource issues.

Overall, The overall turnover of the Business Operations Management division in the United Kingdom is approximately $110 million, of which applications management accounts for $12 million.

1. Method/gy - The key to Success

Andersens illustrate their AMS definition and offerings through the use of a cube, shown in Exhibit V-4.

INVESTIGATE & RESOLVE QUERIES

THE CLIENT

queries
assistance

IDENTIFY SUPPORT TASKS
- log all tasks
- analyse request
- classify request
- agree priority with client
- schedule work
- report back to client

SYSTEM TRACKING
- review daily operations
- identify critical fixes
- report on daily performance

ENHANCEMENT PLAN

Agree with Client

CHANGE ANALYSIS
- identify scope of change
- cost/benefit study
- client agreement
- specify change
- review specification
- plan tasks/resource

PERFORMANCE MONITORING
- review history
- identify trends
- recommend improvements
- report on progress & achievements

APPLICATION CHANGE
- change programs, data, JCL, etc
- unit test
- system test
- update all documentation
- quality check
- liaise with client

IMPLEMENTATION
- client training
- acceptance testing
- client authorisation
- transfer to production

PROBLEM TRACKING: * All tasks logged and assigned priority   * Analysis of workload
* Progress monitored at each stage   * Client reporting
* Client updated on progress

Source: ITnet

ITnet establishes a clear set of Service Levels for every Applications Support ~~team~~ *project* providing the client with a clear view of the service and its minimum level, with only minor fluctuation and guaranteed resource availability. Service Levels typically cover the following:

- the extent of support cover (hours per day, week and year)
- guarantees to log, prioritize and follow-up every call or incident
- a definition of priorities related to the business
- a schedule and definition of regular management reports to be provided
- minimum percentage of high priority tasks to be resolved in a day
- initiatives to be undertaken to stop recurring problems and improve performance

Exhibit V-8 illustrates shows the reporting structure used for each project.

Exhibit V-8

Management Reporting
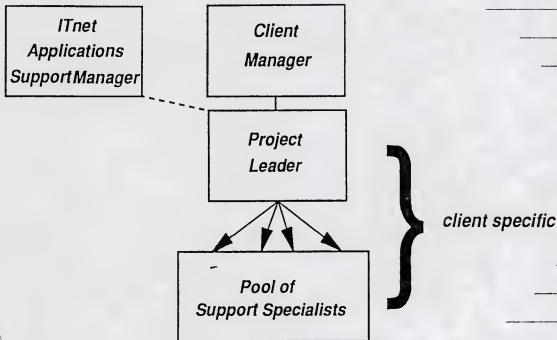

Client calls for assistance are routed through the IT net Help Desk to the Applications Support Help Desk to the pool of support specialists *as shown in Exhibit V-9.*

Call/Problem Handling

Requests for assistance from client

ITnet believes that technologies such as Telon and Code Surveyor have their place but the real key to success with a client's application management lies in the project management and methods and procedures tailored to suit the client's needs.

Example contracts include the following:

$1.7 million

CCSB (Coca Cola Schweppes Bovril). This is a three year contract worth ~~£900,00~~ per year where ITnet provides applications management support for the Sales and Marketing, distribution, customer accounting and PC systems.

$200k

Tarmac. A further three year contract generating ~~£100,000~~ per year providing applications support, primarily on payroll using Peterborough software. (ITnet claims to have specialist knowledge of Peterborough Software's products since they are in use with many clients).

Cadbury International. A three year contract providing support on the Dun & Bradstreet Millenium financial and accounting software generating ~~£70,000~~ per year.

$130k

Westminster City Council. About to be announced is a seven year contract for a complete FM and AM outsourcing. The value of the applications management (AM) activity is estimated at ~~£500,000~~ per year.

$1 million

B. 1. Case Study 1
User Profiles

Exhibit V-6

User Case Study - Government Sector - Scenario

IS Objective
- Improve user service / lower costs of economic model

Old Age Problems
- Plan to replace suit of applications
- Some software 20 years old
- Many change requests still
- Obsolete systems hardware/software
- Boring for staff, poorly documented
- High security site

Exhibits V-6 and V-7 summarise the experience of a Government department in contracting out the maintenance and support of a very old database application used for assessing the economic impact of EEC and local policy changes on a national industry.

The objective of contracting out to a third party was to improve the service received by the end-user and to lower the costs of running the service. Some applications are over 20 years old, and although the number of code changes is small, end-users are continually requesting changes to the application parameters and database fields.

To add to the difficulties of keeping the end-users satisfied, the applications run on an old mainframe using an obsolete operating system. The support staff were poorly motivated and eager to acquire a replacement system. The site and the application are subject to high security regulations.

Three vendors were invited to tender. The solution adopted after a careful analysis by the vendors meant a hand-over period of three months, during which one or two of the eight staff remained available to train the vendors employees.

The final terms of the service were a fixed price for an agreed level of support service, plus a time and materials portion for responses to end-user special requests.

Exhibit V-7

User Case Study - Government Sector - Outsourcing

Solution - Outsourcing

- 3rd-party staff working on-site
- Mix of time-and-materials and fixed-price
- 3 months parallel working hand-over
- Users interface direct with vendor

Benefits

- >50% cost saving on staff ~$70K p.a.
- 8 full-time staff replaced by 4 part-time
- System life extended 5 years
- Vendor handles all staffing

Perhaps the most interesting aspect of this example is the way the IS department passed full responsibility to the service vendor who now deals directly with the end-user department on all issues.

The potential cost of any changes is now visible to the end-user management in the form of costed quotations. This has allowed the end-user to improve his own decision making as to the cost effectiveness of changes being requested.

The exercise has been very successful, freeing eight IS staff for use on other projects, reducing the overall workload and dramatically improving the reliability of the system. This has enabled the replacement plans to be put off, freeing the budget for other uses.

The improvements in reliability are a spin-off from the vendor's strong management methods applied to the whole applications software environment. Far less time is now spent analysing and fixing problems (down to only 5%), or re-inventing solutions to problems which have occurred before. This has allowed the vendor to negotiate a lower cost service level which still satisfies the end-users needs.

2. Case Study 2

Exhibit V-8

User Case Study - Telecommunications Sector - Scenario

IS Objective

- Free-up staff & improve user service in materials management

Problems

- Demand for new business systems
- Database growing out of hand
- 5-year history of fast fixes to software
- Bad system response times
- 23 people - fire-fighting support

The second case study is outlined in Exhibits V-8 and V-9. It concerns a large IS group within a Telecommunications PTT, where there is tremendous pressure for new applications which reflect a more customer-facing business stance. Freeing up IS staff with valuable business knowledge was the main objective of considering outsourcing some support and maintenance activities.

The application chosen was a major inventory and warehouse management system implemented at several locations for a regionally organised end-user management.

The five-year-old system had been treated like most heavily used applications - speedy fixing of problems had taken precedence over elegant solutions. So short-cuts had been taken, resulting eventually in some response times, at peak hours, being totally out of hand.

With 23 people employed in supporting the applications, it seemed an excellent test case on which to judge the promises of the service vendor.

In this case the knowledge transfer required to release 19 of the in-house support and development staff took six months. There was also considerable spin-off in knowledge transfer to the computer operations staff, as the vendor applied improved working practices to establishing a stable and reliable software environment.

Exhibit V-9

User Case Study - Telecommunications Sector - Outsourcing

Solution - Outsourcing
- 3rd-party took prime responsibility
- Mix of in-house and 3rd-party staffing
- 6 months for knowledge transfer
- Client's quality system
- Planned reviews under client's direction

Benefits
- 19 staff released for new projects
- Users happy - good response times
- Call-outs reduced ten-fold
- System reliability and life extended
- Working practices adopted by client

The vendor established procedures for configuration control, software testing and release, which conformed to the users own internal quality procedures and standards. In fact considerable energy was put into establishing a tight teamwork approach with shared office space and good communications at all working levels.

The results were exceptionally good, with response times down to a level at which it is going to be hard to find an adequate replacement system in the future. There is no doubt that the system's life has been extended by pro-active management - compared to its previous reactive fire-fighting status.

The original high level of end-user complaint has given way to silent satisfaction and the original 24-hour emergency service level has been reduced to a normal working hours service.

Many of the new working practices introduced by the vendor have been adopted by the IS client management.
